

Package ‘ggvenn’

October 8, 2025

Title Draw Venn Diagram by 'ggplot2'

Version 0.1.19

Author Linlin Yan [aut, cre] (ORCID: <<https://orcid.org/0000-0002-4990-6239>>)

Maintainer Linlin Yan <yanlinlin82@gmail.com>

Description An easy-to-use way to draw pretty Venn diagrams using 'ggplot2'.

This package provides functions to create Venn diagrams with customizable colors, labels, and styling options.

<code>data_preparation</code>	<i>Utility functions for data type conversion between data.frame and list.</i>
-------------------------------	--

Description

Utility functions for data type conversion between data.frame and list.

Usage

```
data_frame_to_list(x)

list_to_data_frame(x)
```

Arguments

<code>x</code>	A data.frame with logical columns representing sets, or a list of sets.
----------------	---

Value

A list of sets or a data.frame with logical columns representing sets.

Examples

```
# Convert data.frame to list
d <- dplyr::tibble(name = 1:6,
                    A = c(rep(TRUE, 5), FALSE),
                    B = rep(c(FALSE, TRUE), each = 3))
print(d)
data_frame_to_list(d)

# Convert list to data.frame
a <- list(A = 1:5, B = 4:6)
print(a)
list_to_data_frame(a)

# Round-trip conversion
identical(a, data_frame_to_list(list_to_data_frame(a))) # TRUE
identical(d, list_to_data_frame(data_frame_to_list(d))) # TRUE
```

<code>geom_venn</code>	<i>Plot venn diagram as a ggplot layer object. It supports only data frame as input.</i>
------------------------	--

Description

Plot venn diagram as a ggplot layer object. It supports only data frame as input.

Usage

```
geom_venn(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  set_names = NULL,
  element_column = NULL,
  show_elements = FALSE,
  show_set_totals = "none",
  show_stats = c("cp", "c", "p"),
  show_counts = TRUE,
  show_percentage = TRUE,
  digits = 1,
  label_sep = ",",
  count_column = NULL,
  show_outside = c("auto", "none", "always"),
  auto_scale = FALSE,
  fill_color = default_color_list,
  fill_alpha = 0.5,
  stroke_color = "black",
  stroke_alpha = 1,
  stroke_size = 1,
  stroke_linetype = "solid",
  set_name_color = "black",
  set_name_size = 6,
  text_color = "black",
  text_size = 4,
  comma_sep = FALSE,
  padding = 0.2,
  max_elements = 6,
  text_truncate = TRUE
)
```

Arguments

<code>mapping</code>	Set of aesthetic mappings created by aes() . If specified and <code>inherit.aes = TRUE</code> (the default), it is combined with the default mapping at the top level of the plot. You must supply <code>mapping</code> if there is no plot mapping.
<code>data</code>	A <code>data.frame</code> or a list as input data.
<code>stat</code>	The statistical transformation to use on the data for this layer, as a string.
<code>position</code>	A position adjustment to use on the data for this layer. This can be used in various ways, including to prevent overplotting and improving the display. The <code>position</code> argument accepts the following: <ul style="list-style-type: none"> • The result of calling a position function, such as <code>position_jitter()</code>. This method allows for passing extra arguments to the position.

- A string naming the position adjustment. To give the position as a string, strip the function name of the position_ prefix. For example, to use `position_jitter()`, give the position as "jitter".
- For more information and other ways to specify the position, see the [layer position](#) documentation.

...

Other arguments passed on to `layer()`'s `params` argument. These arguments broadly fall into one of 4 categories below. Notably, further arguments to the `position` argument, or aesthetics that are required can *not* be passed through `...`. Unknown arguments that are not part of the 4 categories below are ignored.

- Static aesthetics that are not mapped to a scale, but are at a fixed value and apply to the layer as a whole. For example, `colour = "red"` or `linewidth = 3`. The geom's documentation has an **Aesthetics** section that lists the available options. The 'required' aesthetics cannot be passed on to the `params`. Please note that while passing unmapped aesthetics as vectors is technically possible, the order and required length is not guaranteed to be parallel to the input data.
- When constructing a layer using a `stat_*`() function, the `...` argument can be used to pass on parameters to the `geom` part of the layer. An example of this is `stat_density(geom = "area", outline.type = "both")`. The geom's documentation lists which parameters it can accept.
- Inversely, when constructing a layer using a `geom_*`() function, the `...` argument can be used to pass on parameters to the `stat` part of the layer. An example of this is `geom_area(stat = "density", adjust = 0.5)`. The stat's documentation lists which parameters it can accept.
- The `key_glyph` argument of `layer()` may also be passed on through `...`. This can be one of the functions described as [key glyphs](#), to change the display of the layer in the legend.

<code>set_names</code>	Set names, use column names if omitted.
<code>element_column</code>	A single character value use as column name to select elements.
<code>show_elements</code>	Show set elements instead of count/percentage.
<code>show_set_totals</code>	Show total count (c) and/or percentage (p) for each set. Pass a string like "cp" to show both. Any other string like "none" to hide both.
<code>show_stats</code>	Show count (c) and/or percentage (p) for each set. Pass a string like "cp" to show both.
<code>show_counts</code>	Show count for each set.
<code>show_percentage</code>	Show percentage for each set.
<code>digits</code>	The desired number of digits after the decimal point.
<code>label_sep</code>	Separator character for displaying elements.
<code>count_column</code>	Specify column for element repeat count.
<code>show_outside</code>	Show outside elements (not belongs to any set). Options: "auto", "none", "always".
<code>auto_scale</code>	Allow automatically resizing circles according to element counts (only for 2-set diagrams).

<code>fill_color</code>	Filling colors in circles. Can be a single color or a vector of colors for each set.
<code>fill_alpha</code>	Transparency for filling circles. Can be a single value or a vector for each set.
<code>stroke_color</code>	Stroke color for drawing circles. Can be a single color or a vector of colors for each set.
<code>stroke_alpha</code>	Transparency for drawing circles. Can be a single value or a vector for each set.
<code>stroke_size</code>	Stroke size for drawing circles. Can be a single value or a vector for each set.
<code>stroke_linetype</code>	Line type for drawing circles. Can be a single value or a vector for each set.
<code>set_name_color</code>	Text color for set names.
<code>set_name_size</code>	Text size for set names.
<code>text_color</code>	Text color for intersect contents.
<code>text_size</code>	Text size for intersect contents.
<code>comma_sep</code>	Whether to use comma as separator for displaying numbers.
<code>padding</code>	Padding for the plot. Change this to allow longer labels to be displayed.
<code>max_elements</code>	Maximum number of elements to display when <code>show_elements=TRUE</code> .
<code>text_truncate</code>	Whether to truncate text when elements exceed <code>max_elements</code> .

Value

A ggplot layer object to add to a ggplot.

Examples

```
library(ggvenn)

# use data.frame as input
d <- dplyr::tibble(
  value = c(1, 2, 3, 5, 6, 7, 8, 9),
  `Set 1` = c(TRUE, FALSE, TRUE, TRUE, FALSE, TRUE, FALSE, TRUE),
  `Set 2` = c(TRUE, FALSE, FALSE, TRUE, FALSE, FALSE, FALSE, TRUE),
  `Set 3` = c(TRUE, TRUE, FALSE, FALSE, FALSE, FALSE, TRUE, TRUE),
  `Set 4` = c(FALSE, FALSE, FALSE, FALSE, TRUE, TRUE, FALSE, FALSE)
)

# ggplot gramma
ggplot(d) +
  geom_venn(aes(A = `Set 1`, B = `Set 2`)) +
  coord_fixed() +
  theme_void()
ggplot(d) +
  geom_venn(aes(A = `Set 1`, B = `Set 2`, C = `Set 3`)) +
  coord_fixed() +
  theme_void()
```

```

ggplot(d) +
  geom_venn(aes(A = `Set 1`, B = `Set 2`, C = `Set 3`, D = `Set 4`)) +
  coord_fixed() +
  theme_void()

# set fill color
ggplot(d) +
  geom_venn(aes(A = `Set 1`, B = `Set 2`), fill_color = c("red", "blue")) +
  coord_fixed() +
  theme_void()

# hide percentage
ggplot(d) +
  geom_venn(aes(A = `Set 1`, B = `Set 2`), show_stats = "c") +
  coord_fixed() +
  theme_void()

# change precision of percentages
ggplot(d) +
  geom_venn(aes(A = `Set 1`, B = `Set 2`), digits = 2) +
  coord_fixed() +
  theme_void()

# show elements instead of count/percentage
ggplot(d) +
  geom_venn(aes(A = `Set 1`, B = `Set 2`, C = `Set 3`, D = `Set 4`, label = value)) +
  coord_fixed() +
  theme_void()

```

get_venn_table*Extract Venn diagram data table from ggvenn plot***Description**

Extract Venn diagram data table from ggvenn plot

Usage

```
get_venn_table(g)
```

Arguments

g	A ggplot object created by ggvenn()
----------	-------------------------------------

Value

A data frame containing the Venn diagram intersection data

Examples

```
library(ggvenn)
g <- ggvenn(list(A = 1:5, B = 4:9, C = c(2:3, 8:12), D = c(1, 5, 9)))
get_venn_table(g)
```

ggvenn

Plot venn diagram as an independent function. It supports both data frame and list as input.

Description

Plot venn diagram as an independent function. It supports both data frame and list as input.

Usage

```
ggvenn(
  data,
  columns = NULL,
  element_column = NULL,
  show_elements = FALSE,
  show_set_totals = "none",
  show_stats = c("cp", "c", "p"),
  show_counts = TRUE,
  show_percentage = TRUE,
  digits = 1,
  label_sep = ",",
  count_column = NULL,
  show_outside = c("auto", "none", "always"),
  auto_scale = FALSE,
  fill_color = default_color_list,
  fill_alpha = 0.5,
  stroke_color = "black",
  stroke_alpha = 1,
  stroke_size = 1,
  stroke_linetype = "solid",
  set_name_color = "black",
  set_name_size = 6,
  text_color = "black",
  text_size = 4,
  comma_sep = FALSE,
  padding = 0.2,
  max_elements = 6,
  text_truncate = TRUE
)
```

Arguments

<code>data</code>	A <code>data.frame</code> or a list as input data.
<code>columns</code>	A character vector use as index to select columns/elements.
<code>element_column</code>	A single character value use as column name to select elements. It is only allowed when <code>data</code> is a <code>data.frame</code> .
<code>show_elements</code>	Show set elements instead of count/percentage.
<code>show_set_totals</code>	Show total count (c) and/or percentage (p) for each set. Pass a string like "cp" to show both. Any other string like "none" to hide both.
<code>show_stats</code>	Show count (c) and/or percentage (p) for each set. Pass a string like "cp" to show both. Any other string like "none" to hide both.
<code>show_counts</code>	Show count for each set.
<code>show_percentage</code>	Show percentage for each set.
<code>digits</code>	The desired number of digits after the decimal point.
<code>label_sep</code>	Separator character for displaying elements.
<code>count_column</code>	Specify column for element repeat count.
<code>show_outside</code>	Show outside elements (not belongs to any set). Options: "auto", "none", "always".
<code>auto_scale</code>	Allow automatically resizing circles according to element counts (only for 2-set diagrams).
<code>fill_color</code>	Filling colors in circles. Can be a single color or a vector of colors for each set.
<code>fill_alpha</code>	Transparency for filling circles. Can be a single value or a vector for each set.
<code>stroke_color</code>	Stroke color for drawing circles. Can be a single color or a vector of colors for each set.
<code>stroke_alpha</code>	Transparency for drawing circles. Can be a single value or a vector for each set.
<code>stroke_size</code>	Stroke size for drawing circles. Can be a single value or a vector for each set.
<code>stroke_linetype</code>	Line type for drawing circles. Can be a single value or a vector for each set.
<code>set_name_color</code>	Text color for set names.
<code>set_name_size</code>	Text size for set names.
<code>text_color</code>	Text color for intersect contents.
<code>text_size</code>	Text size for intersect contents.
<code>comma_sep</code>	Whether to use comma as separator for displaying numbers.
<code>padding</code>	Padding for the plot. Change this to allow longer labels to be displayed.
<code>max_elements</code>	Maximum number of elements to display when <code>show_elements=TRUE</code> .
<code>text_truncate</code>	Whether to truncate text when elements exceed <code>max_elements</code> .

Value

The `ggplot` object to print or save to file.
